Session 102: Is mathematics, in its pure form, a universal language?

Summary:
Mathematics it’s the human objective way to associate subjective information. It allows the consciousness to differentiate, to label and to isolate. Human beings have the need to break something into pieces to be able to see the whole. In other realities this need doesn’t exist, as there’s a knowing of the whole without the focus to identify the various parts. So it will be a false direction to say mathematics is a universal language outside the earth plane. When man ceases to consider himself the center of the universe, and tries to bring other realities to fit into his mathematical formula only then he can continue to grow.
